Actuators

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | actuators.c actuators.h |
| Needs | 'timers' library |
| Description | This library is able to control 2 electric actuators. |
| Remarks | None |
| Instructions | 1. Call actuatorsInit() in your main program initialization 2. Enable interrupts in your program (<avr/interrupt.h> is needed (compiler)) |

actuatorsInit

| | | | |
|--------------------|--|-------|--|
| Description | Initialize the actuator ports and calibrate the actuators hardware limits. | | |
| Parameters | uint8_t <i>minActuator1</i> | 0-255 | Minimum position of actuator 1, which equals 'value' 0 at actuatorsPositionSet() |
| | uint8_t <i>maxActuator1</i> | 0-255 | Maximum position of actuator 1, which equals 'value' 100 at actuatorsPositionSet() |
| | uint8_t <i>minActuator2</i> | 0-255 | Minimum position of actuator 2, which equals 'value' 0 at actuatorsPositionSet() |
| | uint8_t <i>maxActuator2</i> | 0-255 | Maximum position of actuator 1, which equals 'value' 100 at actuatorsPositionSet() |
| Returns | None | | |
| Example(s) | <pre>actuatorsInit(25,103,0,0); // Initialize the actuators // actuator 1 moves between 25,103 and actuator 2 isn't used</pre> | | |

actuatorsEnable

| | | | |
|--------------------|---|-----|---------------------|
| Description | Enable or disable an actuator. Only leave them enabled when needed. | | |
| Parameters | uint8_t <i>actuator</i> | 1-2 | Select the actuator |
| | uint8_t <i>state</i> | 0-1 | 1 = on, 0 = off |
| Returns | None | | |
| Example(s) | <pre>actuatorsEnable(1,1); // Enables actuator 1</pre> | | |

actuatorsPositionSet

| | | | |
|--------------------|---|-------|---------------------|
| Description | Set a new position for a actuator. You may do this before enabling the actuator. | | |
| Parameters | uint8_t <i>actuator</i> | 1-2 | Select the actuator |
| | uint8_t <i>position</i> | 0-100 | The new position |
| Returns | None | | |
| Example(s) | <code>actuatorsPositionSet(1,50); // Set the position of actuator 1 to 50 out of 100</code> | | |

ADC

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | adc.c adc.h |
| Needs | None |
| Description | This library controls the analog inputs and supplies readout. |
| Remarks | None |
| Instructions | 1. Call <code>adclnit()</code> in your main program initialization |

adclnit

| | |
|--------------------|--|
| Description | Initialize the analog inputs. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>adclnit();</code> <code>// Initialize the analog inputs</code> |

adcGet

| | | | |
|--------------------|---|----------|---|
| Description | Get the current value of an analog input | | |
| Parameters | <code>uint8_t adc</code> | 1-2 | Select the analog input |
| | <code>uint8_t averaging</code> | 1-255 | How many measurements must be taken before returning the averaged value (at least 16 is advised). |
| Returns | <code>uint16_t value</code> | 0 – 1023 | The value of the channel |
| Example(s) | <code>myVar = adcGet(1,16);</code> <code>// get an averaged value (16 measurements) for analog input 1</code> | | |

Buzzer

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | buzzer.c buzzer.h |
| Needs | None |
| Description | This library controls the buzzer. |
| Remarks | None |
| Instructions | 1. Call <code>buzzerInit()</code> in your main program initialization 2. Enable interrupts in your program (<avr/interrupt.h> is needed (compiler)) |

buzzerInit

| | |
|--------------------|---|
| Description | Initialize the buzzer output and timer |
| Parameters | None |
| Returns | None |
| Example(s) | <code>buzzerInit(); // Initialize the buzzer</code> |

buzzerEnable

| | |
|--------------------|---|
| Description | Enable or disable the buzzer |
| Parameters | <code>uint8_t state</code> 0-1 1 = on, 0 = off |
| Returns | None |
| Example(s) | <code>buzzerEnable(1); // Enable the buzzer</code> |

buzzerToneSet

| | |
|--------------------|--|
| Description | Set the tone of the buzzer. You may do this before enabling it. |
| Parameters | <code>uint16_t tone</code> 0-923 Set the tone between 61Hz and 20kHz. Note that it isn't linear. The higher a tone, the bigger the frequency steps. |
| Returns | None |
| Example(s) | <code>buzzerToneSet(448); // Set the tone of the buzzer around 1kHz</code> |

Hitachi (display)

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | hitachi.c hitachi.h |
| Needs | None |
| Description | This library controls an optional display with a hitachi chip (most character displays). Only basic functions will be explained. Other possibilities to send/receive can be found in the AVR-libc Library Reference. |
| Remarks | None |
| Instructions | 1. Call displayInit() in your main program initialization |

displayInit

| | | | |
|--------------------|--|------|------------------------------------|
| Description | Initialize the display and backlight. | | |
| Parameters | uint8_t <i>width</i> | 1-40 | The width of the display |
| | uint8_t <i>lines</i> | 1-4 | The number of lines on the display |
| Returns | None | | |
| Example(s) | displayInit(20,2); // Initialize a display of 20 characters wide and 2 lines | | |

displayGotoXY

| | | | |
|--------------------|---|------|-----------------------------------|
| Description | Place the cursor at a certain position on the display | | |
| Parameters | uint8_t <i>x</i> | 0-39 | X position (character number – 1) |
| | uint8_t <i>y</i> | 0-3 | Y position (line number – 1) |
| Returns | None | | |
| Example(s) | displayGotoXY(0,1); // Goto begin of second line | | |

displayClear

| | | | |
|--------------------|---|--|--|
| Description | Clear the display content and reset the cursor location to the top left | | |
| Parameters | None | | |
| Returns | None | | |
| Example(s) | displayClear(); // Clear the display content | | |

displayCursor

| | | | |
|--------------------|---|-----|--|
| Description | Show or hide the cursor | | |
| Parameters | uint8_t <i>onoff</i> | 0-1 | 1 = show, 0 = hide |
| | uint8_t <i>blink</i> | 0-1 | 1 = blinking cursor (when showed), 0 = cont. |
| Returns | None | | |
| Example(s) | displayCursor(1,1); // Show a blinking cursor | | |

displayBacklight

| | | | |
|--------------------|--|-----|-----------------|
| Description | Enable or disable the backlight | | |
| Parameters | uint8_t <i>state</i> | 0-1 | 1 = on, 0 = off |
| Returns | None | | |
| Example(s) | displayBacklight(1); // Enable the backlight | | |

fputc

| | | | |
|--------------------|--|--------|---|
| Description | Put a character on the display. This is actually a GCC library (stdio.h) but you need to know how to use it for the display. For a complete reference of this function look into the GCC reference. | | |
| Parameters | char <i>data</i> | 0-255 | The character you want to put on the stream |
| | FILE <i>stream</i> | FILE * | The stream you want to put a character to |
| Returns | int <i>data</i> | 0-255 | The character you have put on the stream |
| Example(s) | fputc('H',display); // Put the character 'H' on the display | | |

fputs

| | | | |
|--------------------|--|--------|---|
| Description | Put a string with variables on the display. This is actually a GCC library (stdio.h) but you need to know how to use it for the display. | | |
| Parameters | char* <i>data</i> | char* | The string you want to put on the stream |
| | FILE <i>stream</i> | FILE * | The stream you want to put a character to |
| Returns | int <i>data</i> | 0-255 | The character you have put on the stream |
| Example(s) | fputs("Hoi",display); // Put 'Hoi' on the display | | |

fprintf

| | | | |
|--------------------|--|--------|--|
| Description | Put a string with variables on the display. This is actually a GCC library (stdio.h) but you need to know how to use it for the display. | | |
| Parameters | FILE <i>stream</i> | FILE * | The stream you want to put a string to For the rest of the parameters/returns look into the GCC reference for fprintf |
| Example(s) | fprintf(display,"The variable is on %d",myVar); // Print a string on the display | | |

I2C

| | |
|---------------------|---|
| Version | 1.0.0 |
| Files | i2c.c i2c.h |
| Needs | None |
| Description | This library reads the digital inputs. |
| Remarks | Input 3 and output 3 cannot be used when using i2c! All devices supported by YAAB will have their own library, just use i2cInit from this library. |
| Instructions | 1. Call i2cInit() in your main program initialization |

I2cInit

| | |
|--------------------|--|
| Description | Initialize the i2c ports |
| Parameters | None |
| Returns | None |
| Example(s) | i2cInit(); // Initialize the i2c ports |

I2cStart

| | |
|--------------------|--|
| Description | Send a (repeated)start condition |
| Parameters | None |
| Returns | None |
| Example(s) | i2cStart(); // Reset the i2c bus and start new command |

I2cStop

| | |
|--------------------|--|
| Description | Send a stop condition |
| Parameters | None |
| Returns | None |
| Example(s) | i2cStop(); // Send a stop command on the i2c bus |

I2cWr

| | | | |
|--------------------|--|-------|---------------------------------------|
| Description | Write a byte to the i2c bus | | |
| Parameters | uint8_t <i>data</i> | 0-255 | The data you want to write to the bus |
| Returns | uint8_t <i>error</i> | 0-1 | 1 = NACK, 0 = ACK |
| Example(s) | <pre>myVar = i2cWr(0x80); // Write 0x80 to the bus if (myVar == 1) { // We received a NACK }</pre> | | |

I2cRd

| | | | |
|--------------------|--|-------|-------------------------------------|
| Description | Read a byte from the i2c bus | | |
| Parameters | uint8_t <i>ack/nack</i> | 0-1 | Return a ack/nack 1 = ACK, 0 = NACK |
| Returns | uint8_t <i>data</i> | 0-255 | The data read from the i2c bus |
| Example(s) | <pre>myVar = i2cRd(1); // Get a byte from the i2c bus and return a ack</pre> | | |

I2c IO

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | i2cIO.c i2cIO.h |
| Needs | i2c library |
| Description | This library controls the i2c I/O Expander(s) for YAAB |
| Remarks | You can control a maximum of eight I/O Expanders |
| Instructions | 1. Call i2cIOConfigure() in your main program initialization for each I/O Expander |

I2cIOConfigure

| | | | |
|--------------------|--|-------|---|
| Description | Configure a I/O Expander | | |
| Parameters | uint8_t <i>address</i> | 0-7 | Which address you want to configure |
| | uint8_t <i>outputs</i> | 0-255 | Which I/Os should be output (1 = output, 0 = input) (bit 0 = i/o 0, etc) |
| Returns | None | | |
| Example(s) | i2cIOConfigure(0,0xF0); // Configure expander 0, setting upper 4 i/o on output | | |

I2cIOSet

| | | | |
|--------------------|--|-----|--|
| Description | Set a single i/o on a expander (which is configured as output) | | |
| Parameters | uint8_t <i>address</i> | 0-7 | Which address you want to set the i/o on |
| | uint8_t <i>io</i> | 1-8 | Which i/o you want to set |
| | uint8_t <i>state</i> | 0-1 | 1 = on, 0 = off |
| Returns | None | | |
| Example(s) | i2cIOSet(0,1,1); // Set the first i/o to 'on' on expander 0 | | |

I2cIOSetRaw

| | | | |
|--------------------|--|-------|---|
| Description | Set all i/o on a expander (discarding the output/input settings) | | |
| Parameters | uint8_t <i>address</i> | 0-7 | Which address you want to set the i/o on |
| | uint8_t <i>io</i> | 0-255 | Which I/Os should be on/off (1 = on, 0 = off) (bit 0 = i/o 0, etc) |
| Returns | None | | |
| Example(s) | i2cIOSetRaw(0,0x0F); // Set the first 4 i/o 'on' on expander 0 | | |

i2cIOGet

| | | | |
|--------------------|---|-----|--|
| Description | Get the status of a single i/o (which is configured as input) | | |
| Parameters | uint8_t <i>address</i> | 0-7 | Which address you want to get the i/o from |
| | uint8_t <i>io</i> | 1-8 | Which i/o status you want to get |
| Returns | uint8_t <i>state</i> | 0-1 | 1 = on, 0 = off |
| Example(s) | myVar = i2cIOGet(0,4); // Get the fourth i/o status of expander 0 | | |

i2cIOGetRaw

| | | | |
|--------------------|---|-------|---|
| Description | Get the status of all i/o (discarding they are in- or output) | | |
| Parameters | uint8_t <i>address</i> | 0-7 | Which address you want to get the i/o's from |
| Returns | uint8_t <i>io</i> | 0-255 | The i/o status of all i/o (1 = on, 0 = off) (bit 0 = i/o 0, etc) |
| Example(s) | i2cIOGetRaw(0); // Get all the i/o status of expander 0 | | |

Inputs

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | inputs.c inputs.h |
| Needs | None |
| Description | This library reads the digital inputs. |
| Remarks | None |
| Instructions | 1. Call inputsInit() in your main program initialization |

inputsInit

| | |
|--------------------|---|
| Description | Initialize the digital inputs. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>inputsInit(); // Initialize the digital inputs</code> |

inputsGet

| | |
|--------------------|--|
| Description | Get the current state of an input. |
| Parameters | <code>uint8_t input</code> 1-5 Which input you want to read |
| Returns | <code>uint8_t state</code> 0-1 1 = active, 0 = idle |
| Example(s) | <code>myVar = inputsGet(2); // Get the state of digital input 2</code> |

inputsGetPressedDebounce

| | |
|--------------------|--|
| Description | See if the input is pressed (with debounce check of 50ms) |
| Parameters | <code>uint8_t input</code> 1-5 Which input you want to read |
| Returns | <code>uint8_t state</code> 0-1 1 = pressed, 0 = idle |
| Example(s) | <code>myVar = inputsGetPressedDebounce(2); // See if input 2 is pressed (debounced)</code> |

inputsGetReleasedDebounce

| | |
|--------------------|--|
| Description | See if the input is released (with debounce check of 50ms) |
| Parameters | <code>uint8_t input</code> 1-5 Which input you want to read |
| Returns | <code>uint8_t state</code> 0-1 1 = released, 0 = active |
| Example(s) | <code>myVar = inputsGetReleasedDebounce(3); // See if input 3 is released (debounced)</code> |

Music

| | |
|---------------------|---|
| Version | 1.0.0 |
| Files | music.c music.h |
| Needs | buzzer library Timers library |
| Description | This library plays music generated with YAABStudio |
| Remarks | Create a song in YAABStudio and paste the generated table in your main.c |
| Instructions | 1. Call musicInit() in your main program initialization 2. Call musicProcess() in your main loop 3. Make sure that <avr/pgmspace.h> is included |

musicInit

| | |
|--------------------|---|
| Description | Initialize the music library |
| Parameters | None |
| Returns | None |
| Example(s) | <code>musicInit(); // Initialize the music library</code> |

musicProcess

| | |
|--------------------|--|
| Description | Process the current song (if started) |
| Parameters | None |
| Returns | None |
| Example(s) | <code>musicProcess(); // Play music</code> |

musicTrackStart

| | |
|--------------------|--|
| Description | Start playing a song. If already playing, you don't need to stop the other first |
| Parameters | <code>_musicTrack *ptr</code> <code>trackName</code> Which track you want to play (table name) |
| Returns | None |
| Example(s) | <code>musicTrackStart(mario); // Start a track called 'mario'</code> |

musicTrackStop

| | |
|--------------------|---|
| Description | Stop playing the current song. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>musicTrackStop(); // Stop playing the current song</code> |

NTC

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | ntc.c ntc.h |
| Needs | None |
| Description | This library converts a ADC value of a ntc to a known temperature unit |
| Remarks | None |
| Instructions | None |

ntcGet

| | | | |
|--------------------|---|--|---|
| Description | Calculate a temperature | | |
| Parameters | uint16_t <i>adc</i> uint8_t <i>unit</i> | 0-65535 NTC_UNIT_CELCIUS NTC_UNIT_FAHRENHEIT NTC_UNIT_KELVIN NTC_UNIT_RANKINE NTC_UNIT_REAUMUR NTC_UNIT_DELISLE NTC_UNIT_ROMER NTC_UNIT_NEWTON | The ADC value of a ntc Celcius Fahrenheit Kelvin Rankine Reaumur Delisle Romer Newton |
| Returns | float <i>temperature</i> | -x.x-x.x | The temperature of the given adc value |
| Example(s) | myValue = ntcGet(703,NTC_UNIT_CELCIUS); // Calc. the temperature in 'C with 703 bit ADC | | |

Outputs

| | |
|---------------------|---|
| Version | 1.1.0 |
| Files | outputs.c outputs.h |
| Needs | None |
| Description | This library controls the digital outputs. |
| Remarks | None |
| Instructions | 1. Call outputsInit() in your main program initialization |

outputsInit

| | |
|--------------------|---|
| Description | Initialize the digital outputs. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>outputsInit(); // Initialize the digital outputs</code> |

outputsGet

| | |
|--------------------|--|
| Description | Get the current state of an output. |
| Parameters | <code>uint8_t output</code> 1-5 Which output you want to read |
| Returns | <code>uint8_t state</code> 0-1 1 = on, 0 = off |
| Example(s) | <code>myVar = outputsGet(1); // Get the state of digital output 1</code> |

outputsSet

| | |
|--------------------|--|
| Description | Set the state of an output. |
| Parameters | <code>uint8_t output</code> 1-5 Which output you want to set <code>uint8_t state</code> 0-2 2 = toggle, 1 = on, 0 = off |
| Returns | None |
| Example(s) | <code>outputsSet(2,1); // Enable digital output 2</code> |

PWM

| | |
|---------------------|--|
| Version | 1.0.0 |
| Files | pwm.c pwm.h |
| Needs | None |
| Description | This library controls the pwm outputs. |
| Remarks | <u>Frequency</u> You can set only 1 frequency for both PWM outputs due they are on the same timer. Note that that each frequency is also linked to the resolution (8-10 bits). |
| Instructions | 1. Call pwmInit() in your main program initialization |

pwmInit

| | |
|--------------------|---|
| Description | Initialize the pwm outputs. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>pwmInit(); // Initialize the pwm outputs</code> |

pwmConfigure

| | | | | | | | | | | |
|--------------------------|---|---|-------------|---|--------------------------|-------------|---|--------------------------|-------------|---|
| Description | Configure the pwm outputs (also enable/disable) | | | | | | | | | |
| Parameters | <table> <tr> <td>uint8_t <i>speed</i></td> <td>PWM_SPEED_*</td> <td>Set the pwm frequency (values in pwm.h)</td> </tr> <tr> <td>uint8_t <i>statePwm1</i></td> <td>PWM_STATE_*</td> <td>Set the state for pwm 1 (values in pwm.h)</td> </tr> <tr> <td>uint8_t <i>statePwm2</i></td> <td>PWM_STATE_*</td> <td>Set the state for pwm 2 (values in pwm.h)</td> </tr> </table> | uint8_t <i>speed</i> | PWM_SPEED_* | Set the pwm frequency (values in pwm.h) | uint8_t <i>statePwm1</i> | PWM_STATE_* | Set the state for pwm 1 (values in pwm.h) | uint8_t <i>statePwm2</i> | PWM_STATE_* | Set the state for pwm 2 (values in pwm.h) |
| uint8_t <i>speed</i> | PWM_SPEED_* | Set the pwm frequency (values in pwm.h) | | | | | | | | |
| uint8_t <i>statePwm1</i> | PWM_STATE_* | Set the state for pwm 1 (values in pwm.h) | | | | | | | | |
| uint8_t <i>statePwm2</i> | PWM_STATE_* | Set the state for pwm 2 (values in pwm.h) | | | | | | | | |
| Returns | None | | | | | | | | | |
| Example(s) | <code>pwmConfigure(PWM_SPEED_244,PWM_STATE_NORMAL,PWM_STATE_INVERTED); // PWM timer on 244Hz, PWM 1 enabled normal, PWM 2 enabled with inverted signal</code> | | | | | | | | | |

pwmValueSet

| | | | | | | | |
|-----------------------|---|--|-----|---------------------|-----------------------|----------------|--|
| Description | Set the value of a pwm | | | | | | |
| Parameters | <table> <tr> <td>uint8_t <i>pwm</i></td> <td>1-2</td> <td>Selected pwm output</td> </tr> <tr> <td>uint16_t <i>value</i></td> <td>0-255/511/1023</td> <td>Set the value. Depending on the SPEED you have taken, its maximum value divers (8/9/10 bit).</td> </tr> </table> | uint8_t <i>pwm</i> | 1-2 | Selected pwm output | uint16_t <i>value</i> | 0-255/511/1023 | Set the value. Depending on the SPEED you have taken, its maximum value divers (8/9/10 bit). |
| uint8_t <i>pwm</i> | 1-2 | Selected pwm output | | | | | |
| uint16_t <i>value</i> | 0-255/511/1023 | Set the value. Depending on the SPEED you have taken, its maximum value divers (8/9/10 bit). | | | | | |
| Returns | None | | | | | | |
| Example(s) | <code>(1,511); // Set pwm 1 on value of 128, halfway the 10bit pwm (+/- 2,5V)</code> | | | | | | |

Timers

| | |
|---------------------|--|
| Version | 1.1.0 |
| Files | timers.c timers.h |
| Needs | None |
| Description | This library allows you to have timeouts and repeating timers for custom use. |
| Remarks | <p><u>Using timer/waits</u></p> <p>It is your own decision to use a blocking wait or a timeout. When you need a short wait you can easily use blocking waits because they cost less cpu time and you don't need to check it. For long timeouts or when you want to do something else while waiting (and not very critical), you can use the timer. This is a background task and you can check yourself if it's done yet. It is also possible to call a function when the timer is done (this is useful when critical timing is needed)</p> <p>You can also time things with a timer (see how much time was used for something).</p> |
| Instructions | <ol style="list-style-type: none">1. Call <code>timersInit()</code> in your main program initialization2. If you want to use timers ('timersSet') make sure you enable interrupts ('sei();' and that <code><avr/interrupt.h></code> is included). |

timersInit

| | |
|--------------------|--|
| Description | Initialize the timers. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>timersInit(); // Initialize the timers.</code> |

timersWaitUs

| | |
|--------------------|---|
| Description | Wait a certain amount of microseconds (us) before continuing (blocking, so program hangs) |
| Parameters | <code>uint16_t value</code> 0-65535 The us you want to wait |
| Returns | None |
| Example(s) | <code>timersWaitUs(500); // Wait for 500 us here</code> |

timersWaitMs

| | |
|--------------------|---|
| Description | Wait a certain amount of milliseconds (ms) before continuing (blocking, so program hangs) |
| Parameters | <code>uint16_t value</code> 0-65535 The ms you want to wait |
| Returns | None |
| Example(s) | <code>timersWaitMs(500); // Wait for 500 ms here</code> |

timersSet

| | | | | | | | | | | | | | | | | | |
|--------------------|--|---------------|---|-----|---------------------------|----------|------------------|---------|-------------------|---------|---------------|-----|---|------|------------------------|---------------|---|
| Description | <p>Set a timer. You need to keep track of your own timers which are in use or free. You can reset a timer at any given time. For example: every time you press a button, you set the timer for 1s. When somebody doesn't press the button within 1 second, you can do something.</p> <p>It is also possible to execute a (callback) function when the timer is triggered.</p> | | | | | | | | | | | | | | | | |
| Parameters | <table border="0"> <tr> <td>uint8_t</td> <td><i>timer</i></td> <td>1-5</td> <td>The timer you want to use</td> </tr> <tr> <td>uint16_t</td> <td><i>timeoutMs</i></td> <td>1-65535</td> <td>The timeout in Ms</td> </tr> <tr> <td>uint8_t</td> <td><i>repeat</i></td> <td>0-1</td> <td>1 = keep repeating the timeout and set a flag when triggered, 0 = just once</td> </tr> <tr> <td>void</td> <td><i>*callback(void)</i></td> <td>TIMERS_CALL_x</td> <td>This is the callback function that will be executed when the timer is triggered. x = 1 – 5. Using a callback instead of calling timersTriggered(), you can be sure that your code is executed immediately. A callback pauses the normal program and forces the callback function to be executed. After this the program is resumed. Because everything stops during execution, you need to do as little as possible in this function.</td> </tr> </table> | uint8_t | <i>timer</i> | 1-5 | The timer you want to use | uint16_t | <i>timeoutMs</i> | 1-65535 | The timeout in Ms | uint8_t | <i>repeat</i> | 0-1 | 1 = keep repeating the timeout and set a flag when triggered, 0 = just once | void | <i>*callback(void)</i> | TIMERS_CALL_x | This is the callback function that will be executed when the timer is triggered. x = 1 – 5. Using a callback instead of calling timersTriggered(), you can be sure that your code is executed immediately. A callback pauses the normal program and forces the callback function to be executed. After this the program is resumed. Because everything stops during execution, you need to do as little as possible in this function. |
| uint8_t | <i>timer</i> | 1-5 | The timer you want to use | | | | | | | | | | | | | | |
| uint16_t | <i>timeoutMs</i> | 1-65535 | The timeout in Ms | | | | | | | | | | | | | | |
| uint8_t | <i>repeat</i> | 0-1 | 1 = keep repeating the timeout and set a flag when triggered, 0 = just once | | | | | | | | | | | | | | |
| void | <i>*callback(void)</i> | TIMERS_CALL_x | This is the callback function that will be executed when the timer is triggered. x = 1 – 5. Using a callback instead of calling timersTriggered(), you can be sure that your code is executed immediately. A callback pauses the normal program and forces the callback function to be executed. After this the program is resumed. Because everything stops during execution, you need to do as little as possible in this function. | | | | | | | | | | | | | | |
| Returns | None | | | | | | | | | | | | | | | | |
| Example(s) | <pre>timersSet(1,1000,1,0); // Create a timer which triggers each second (1000ms) without // callback timersSet(2,500,0,TIMERS_CALL_2); // Create a timeout of 500ms(0,5s) and execute // the 2nd callback function when timer is triggered</pre> <p>The name of the callback function is "timersCallbackx" where x = 1 – 5. Example for implementing the 2nd callback:</p> <pre>timersCallback2 { // Put your code here }</pre> | | | | | | | | | | | | | | | | |

timersGet

| | | | | |
|--------------------|--|--------------|---------|--|
| Description | Get the current value of a timer to see how much time is left. | | | |
| Parameters | uint8_t | <i>timer</i> | 1-5 | The timer you want to read |
| Returns | uint16_t | <i>value</i> | 0-65535 | The value of the timer in timer ticks. To get ms: ms = value / TIMERS_1MS |
| Example(s) | <pre>myValue = timersGet(1); // get the value of timer 1 myMs = myValue / TIMERS_1MS; // Convert the value to milliseconds</pre> | | | |

timersTriggered

| | | | | |
|--------------------|--|---------------|-----|---|
| Description | See if the timer has triggered/ended. | | | |
| Parameters | uint8_t | <i>timer</i> | 1-5 | The timer you want to check |
| Returns | uint8_t | <i>status</i> | 0-1 | 1 = the timer has triggered (repeat)/ended 0 = the timer is still counting |
| Example(s) | <pre>myValue = timersTriggered(1); // See if timer 1 has triggered</pre> | | | |

UART

| | |
|---------------------|---|
| Version | 1.0.0 |
| Files | uart.c uart.h |
| Needs | None |
| Description | This library allows you to communicate via the uart. Only basic functions will be explained. Other possibilities to send/receive can be found in the AVR-libc Library Reference. |
| Remarks | <u>Receive buffer</u> The receive buffer is 64 bytes, which means a pc (or other device) may send 64 characters at one time, and the YAAB can handle it in the background. Once 1 byte is read by the YAAB you can send a character again (FIFO). <u>Communication mode</u> The uart library is always communication with 8-bits, no parity and without any flowcontrol. |
| Instructions | 1. Call <code>uartInit()</code> in your main program initialization 2. Enable interrupts in your program (<avr/interrupt.h> is needed (compiler)) |

uartInit

| | |
|--------------------|---|
| Description | Initialize the uart. |
| Parameters | <code>uint16_t baudrate</code> <code>UART_BAUD_*</code> The baudrate you want (found in uart.h) <code>uint8_t stopbits</code> 1-2 The number of stopbits you want |
| Returns | None |
| Example(s) | <code>uartInit(UART_BAUD_57600,1);</code> // Initialize the uart on 57K6 and with 1 stopbit. |

uartGetCount

| | |
|--------------------|--|
| Description | See how many bytes are received (and which you are allowed to read). |
| Parameters | None |
| Returns | <code>uint8_t count</code> 0-64 The number of bytes in the receive buffer |
| Example(s) | <code>myVar = uartGetCount();</code> // Get the number of bytes in the receive buffer |

uartBufferClear

| | |
|--------------------|--|
| Description | Clear the receive buffer. |
| Parameters | None |
| Returns | None |
| Example(s) | <code>uartBufferClear();</code> // Throw all received bytes away |

fputc

| | | | | |
|--------------------|--|---------------|--------|---|
| Description | Put a character on the uart. This is actually a GCC library (stdio.h) but you need to know how to use it for the uart. For a complete reference of this function look into the GCC reference. | | | |
| Parameters | char | <i>data</i> | 0-255 | The character you want to put on the stream |
| | FILE | <i>stream</i> | FILE * | The stream you want to put a character to |
| Returns | int | <i>data</i> | 0-255 | The character you have put on the stream |
| Example(s) | fputc('H',uart); // Put the character 'H' on the uart | | | |

fgetc

| | | | | |
|--------------------|--|---------------|--------|---|
| Description | Get a character from the receive buffer. This is actually a GCC library (stdio.h) but you need to know how to use it for the uart. For a complete reference of this function look into the GCC reference. | | | |
| Parameters | FILE | <i>stream</i> | FILE * | The stream you want to get a character from |
| Returns | int | <i>data</i> | 0-255 | The character from the stream |
| Example(s) | myVar = fgetc(uart); // Get a character from the uart receive buffer | | | |

fputs

| | | | | |
|--------------------|--|---------------|--------|---|
| Description | Put a string with variables on the uart. This is actually a GCC library (stdio.h) but you need to know how to use it for the uart. | | | |
| Parameters | char* | <i>data</i> | char* | The string you want to put on the stream |
| | FILE | <i>stream</i> | FILE * | The stream you want to put a character to |
| Returns | int | <i>data</i> | 0-255 | The character you have put on the stream |
| Example(s) | fputs("Hoi",uart); // Put 'Hoi' on the uart | | | |

fprintf

| | | | | |
|--------------------|---|---------------|--------|--|
| Description | Put a string on the uart. This is actually a GCC library (stdio.h) but you need to know how to use it for the uart. | | | |
| Parameters | FILE | <i>stream</i> | FILE * | The stream you want to put a string to For the rest of the parameters/returns look into the GCC reference for fprintf |
| Example(s) | fprintf(uart,"The variable is on %d",myVar); // Print a string on the uart | | | |
